MIGRATION TO MARYLAND

AN ANALYSIS OF SOCIOECONOMIC CHARACTERISTICS

MARYLAND STATE PLANNING DEPARTMENT

Wye Oak, pictured on the cover, is the official State tree of Maryland. Located in Wye Mills on Maryland's Eastern Shore, this magnificent white oak is one of the largest in the United States. It was over 100 years old when Leonard Calvert led Maryland's first colonists ashore in March of 1634. Photograph courtesy of Maryland Department of Economic Development.

The preparation of this document was financially aided through a Federal grant from the Department of Housing and Urban Development under the Urban Planning Assistance Program Authorized by Section 701 of the Housing Act of 1954, as amended.

Honorable Spiro T. Agnew
Governor of Maryland
The State House
Annapolis, Maryland

Dear Governor Agnew:

I am pleased to transmit the enclosed report entitled Migration to Maryland: An Analysis of Socio-Economic Characteristics. This report is another in the series being developed for the State-Wide Planning Program administered by this department. While a substantial portion of the work embodied in this report was carried out during the tenure of my predecessor, Mr. James J. O'Donnell, I am most pleased to have been associated with the project in its final phase.

This report provides a large body of data pertaining to the socio-economic characteristics of persons who have migrated into the State during the years 1955-1960. It should be noted that the data that formed the basis for this report were obtained from unpublished census of population tabulations prepared specifically for the department.

We feel certain that this report will be helpful to many individuals, agencies and departments who are interested in obtaining greater insights into the nature of population growth during recent years. Copies of this report are being distributed throughout the State.

Sincerely yours,

Vladimir Wahbe

Vladimir A. Wahbe
Director

Preface

This report was prepared for the purpose of providing data on in-migration to Maryland that would be useful to comprehensive studies of development patterns throughout the State. Interest in the socio-economic characteristics of in-migrants appears particularly relevant for Maryland which ranks high among the states experiencing significant population growth in recent decades.

Special praise is due Regina Seltzer of the State Planning Department for her assistance throughout the preparation of this report. The department is particularly grateful for the advice and support given to this project by the Population Division of the Bureau of the Census.

Arthur Benjamin, Economist

INTRODUCTION

This report presents cross-tabulations of key socio-economic characteristics of persons who had migrated into specific parts of the State between the period 1955-1960. The selection of in-migration as a field of investigation appears particularly important in terms of broad-gage inquiries into the methods and problems of comprehensive State development planning and, in particular, the information needed for such planning. Usually, any attempt at the evaluation of the impact of migration on an area's population structure must depend on indirect measures of migration which permit estimation of the net effect of migration during intercensal periods or on direct measures of migration based specifically on information derived from the decennial United States censuses in which questions have been asked on person movement in the years immediately preceding the census year.

In the 1960 census, mobility of the population was determined by asking respondents whether they were living in the same house on April 1, 1955. For those respondents who were living in a different house, information was obtained on their place of residence in 1955. Accordingly, for each person, mobility status was determined by comparison of place of residence in 1955 with place of residence in 1960. In the published census volumes, the information available by counties for migration are provided in terms of the standard categories used by the Bureau of the Census without any cross-tabulation by social and economic characteristics. In order to supplement the available published census data, special tabulations were obtained from the Bureau of the Census for each county in Maryland, providing tallies of migration status of the population cross-tabulated by variables such as age, sex, income, occupation, industry, labor force status, and level of educational attainment. In addition, in these special tabulations place of residence in 1960 was also given in terms of size of place.

In order to insure an adequate number of cases in the individual cells of the cross-tabulations, county data was combined into subregions within the State. In many instances, these subregions which were delineated for overall State-wide planning study purposes,provided meaningful geographical units for analysis of the migration data. Among other criteria used for the grouping of counties into subregions, the homogeniety of social and economic characteristics of the existing subregion's population was particularly meaningful for use in migration analysis. The counties which make up each subregion are listed in Chart 1. It should be noted that the data in all the tables in this report represent a directional flow of in-migrants to specific subregions within the State during the period 1955-1960. The data does not describe intra-state movements of persons from one county or subregion to another within the State. While it would be useful to have obtained data on intra-state movements of persons and on the characteristics of all persons migrating out of the State, enormous cost factors prevented the pursuit of this objective.

It is because the relationship between economic growth and population change hinges upon migration, that the analysis of migration, despite the difficulty of analytical structuring, is too crucial to be ignored. We have therefore viewed these cross-tabulations of the characteristics of in-migrants as an initial search for patterns that will provide guidelines in which to formulate additional investigations. In this respect, however, specific interrelated areas of inquiry can be noted. We need to begin to understand urbanization within the State as it reflects the pattern of human resource allocation. We also require information about the characteristics of persons migrating to areas within the State that have experienced net out-migration during a specified period of time. In Maryland, both the Western

Maryland subregion and the Eastern Shore are in this category, as are a number of other areas within the State that are classified as rural farm.

If migration is selective of particular segments of the population and if it is primarily a response to differential economic opportunity, then we must assume that this can have an important structural impact upon population agglomerations, as well as to cause changes in geographical size differentials among these agglomerations. Accordingly, in tables 1 through 8, the socio-economic characteristics of in-migrants are cross-tabulated by size of place. The census of population defines size of place as "a concentration or agglomeration of population regardless of the existence of any legally prescribed corporate limits." Therefore, the size categories of population agglomerations used in tables 1 through 8 are as follows:

Central City of an Urbanized Area
Urbanized Area Fringe
Urban Places of 10,000 Persons or More
Other Urban Places
Rural Nonfarm
Rural Farm

Analysis of the dispersion of socio-economic characteristics of in-migrants making specific residence choices is important for the development of insights into the functional roles which may be ascribed to population agglomerations of different size within the State. While it is important to make a distinction between cumulative changes in the socio-economic characteristics of population agglomerations and migration-specific changes, selective in-migration in response to differential economic opportunity may be considered as an important conditioner of the socio-economic structure of both population agglomerations as defined and of larger entities. Therefore, migration-specific socio-economic characteristics provide both an indirect index of needed human resource inputs and an evaluation of the potentials for human resource supply in any given community.

The presentation of cross-tabulations of the socio-economic characteristics of migrants to Maryland also contributed to the development of a data-file of strategic socio-economic indicators for the State. Tabulations of this data for counties is on file in the department and includes much additional detailed information which can be made available to interested organizations.
